

Motive for Branch

The motive behind creating this branch is to fulfill a personal request for a feature. I want a window to come up every time I run IHG that will allow me to pick a download directory, change IHG settings, allow the settings to be session only or global, and give an option to suppress the dialog until it is turned back on via the IHG menu.

Background

The XPCOM library currently does not have a nice way of adding a “filer picker” within another window. The Linux versions of FF come with a file picker dialog which is defunct in windows. The solution is to write an implementation of the file picker for windows. Since we only need the directories, the implementation will be less laborious.

Concept

File Saving Options

☒ Prefix filenames to reflect page order

What to do if file exists in target location?

☐ Rename File ☒ Skip File ☐ Overwrite File

☐ Create a sub-directory with document title inside the target directory

☒ Prefix directories to uniquely and chronologically identify them

☐ Create separate directories for each page when using thread sucker

General

☒ Show the Download Directory box (if unchecked, will use the last directory used)

☒ Remove duplicate links

☐ even across multiple pages.

Embedded Images

☒ Download embedded images

Enter the minimum width and height that will be considered for downloading.

Width: 300 px

Height: 300 px

Host Options

Max. simultaneous HTTP requests

5

Max. number of retries for each link

10

Request timeout before retry (in seconds)

25

☐ Enable time to wait between each set of downloads

Time to wait in seconds

0
